## CLAIMS

1. A multilayer positive temperature coefficient thermistor comprising a multilayer element main body including a plurality of stacked ceramic layers including a barium titanate semiconductor ceramic exhibiting a positive temperature characteristic of resistance and a plurality of internal electrodes including nickel, the internal electrodes being disposed at the interfaces of the ceramic layers,

wherein the conditions

 $5 \le X \le 18$ ; and  $4 \le X \cdot Y \le 10$ 

are satisfied, wherein X is a thickness (µm) of each ceramic layer between the internal electrodes and Y is a donor content (%) in the barium titanate semiconductor ceramic in terms of

(number of donor atoms/number of Ti atoms) × 100.

2. A method for designing a multilayer positive temperature coefficient thermistor comprising a multilayer element main body including a plurality of stacked ceramic layers including a barium titanate semiconductor ceramic exhibiting a positive temperature characteristic of resistance and a plurality of internal electrodes including nickel, the internal electrodes being disposed at the interfaces of the ceramic layers, the method comprising the steps of:

determining a thickness X (mm) of each ceramic layer so as to satisfy the condition  $5 \le X \le 18$ ; and

determining the donor content Y (%) in the barium titanate semiconductor ceramic according to the thickness X so as to satisfy the condition  $4 \le X \cdot Y \le 10$ , wherein the donor content Y is in terms of (number of donor atoms/number of Ti atoms)  $\times$  100.
